

Data Understanding / Raw Data Description

The dataset contains 768 patient records and 9 columns. Each row represents one patient. The goal of the project is to predict whether a patient has diabetes based on diagnostic health measurements.

The target variable is Outcome, where 0 indicates the patient does not have diabetes and 1 indicates the patient has diabetes.

The dataset includes the following features: number of pregnancies, glucose level, blood pressure, skin thickness, insulin level, BMI, diabetes pedigree function, and age.

Column	Meaning
Pregnancies	Number of times patient has been pregnant
Glucose	Blood glucose level
BloodPressure	Diastolic blood pressure
SkinThickness	Triceps skinfold thickness
Insulin	2-hour serum insulin level
BMI	Body Mass Index
DiabetesPedigreeFunction	Genetic/family history diabetes risk score
Age	Patient age
Outcome	Diabetes status: 0 = no diabetes, 1 = diabetes
